

Are We Spending TOO MUCH on Health Care?

BIG NUMBERS

Today, we spend **\$3.5 TRILLION** on health care in the U.S.¹

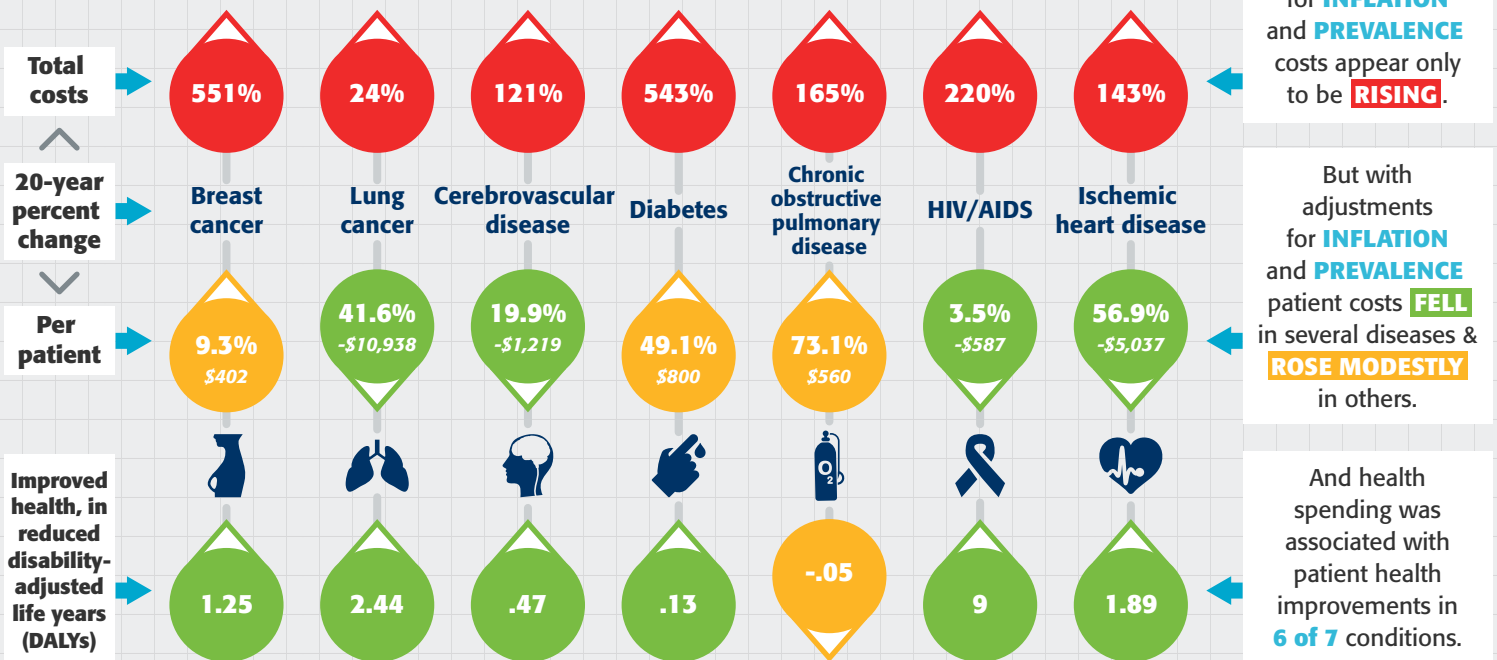

Health spending is expected to grow by **5.5%** annually and reach **\$6 TRILLION BY 2027**²

DIGGING DEEPER

Researchers analyzed³ **spending** for 7 top diseases between 1995 & 2015 and the impact on **patient health**

What did they find?

A CLEARER PICTURE

When researchers dug deeper and accounted for **INFLATION**, **PREVALENCE** and **HEALTH OUTCOMES**,* a clearer picture of health spending in top conditions emerged:

↓ Lower Spending ↑ Improved Health	↑ Higher Spending ↑ Improved Health	↑ Higher Spending ↓ Poorer Health
 Lung cancer	 Breast cancer	 Chronic obstructive pulmonary disease
 Cerebrovascular disease	 Diabetes	
 Ischemic heart disease		
 HIV/AIDS		

*Measured in disability-adjusted life years (DALYs)

THE TAKEAWAY

Policies based on only aggregate health spending figures may mean the wrong areas of health spending are targeted.

Health spending data that:

- ✓ adjusts for increases in prevalence and inflation
- ✓ accounts for patient outcomes

will enable sound, disease-specific policy solutions that address health spending and improve outcomes for patients.
